GISMA Steckverbinder GmbH designs and produces high performance underwater connectors that are deployed deep-sea down to 10.000 m. The actual production line comprises more than 16.000 different electrical, coaxial, fibre-optical, hybrid connectors and penetrators for Offshore, R&D, Renewables and Defence applications. Connectors are available with up to 265 contacts, suiting to a maximum current rating of 1.000 amps and 10.000 V working voltage.

As an independent, medium-sized company with >100 highly qualified employees, we attach particular importance to customer satisfaction, quality, delivery reliability and a partnership-based cooperation. In order to achieve these goals, we consistently rely on our high proportion of in-house production.

Our core competencies are found in underwater connectors that are specially designed for wet underwater mating, large water depths and demanding environmental and operating conditions. Additionally, we constantly offer new, innovative connectors and complete cable system solutions from one source.

Our motivated team consisting of technical sales, project management, design and development is dedicated to customer requests with efficient processes to quickly achieve the optimal solution. With passion we support in complex projects: from the selection matrix and the design sketch, project sketches, 3-D models and rapid prototyping to the end product and it's testing or qualification.
