### **SUCCESSFUL UNDERWATER SURVEILLANCE TEST WITH NOVACAVI'S HYBRID CABLE**

Novacavi recently supported the successful deep mine shaft test of Image Soft's UNWAS – a special underwater surveillance system - with one of its special fibre optic cables. With its hybrid water-blocked configuration, this underwater cable solution acted as a strategic component of the specialised system designed for and used to detect and warn of any potential actions against sensitive critical infrastructure such as pipelines, subsea cables, ports and harbours. "We really appreciate the durable construction and high quality of the Novacavi's cable, which allowed our divers to take the sensor really deep, into a water-filled mine shaft that was full of sharp corners for some special testing" said Tuomas Pöyry, Vice President for Image Soft.

Since 1975 Novacavi has specialised in the design and manufacture of special electric cables used in the most varied and extreme conditions in both civil and military environments. The company has been active in the underwater sector for almost 30 years, producing technologically advanced solutions identified by its *Aquancable*® line, special cables for marine and underwater technologies.

Image Soft Oy is a Helsinki, Finland-based technology company that delivers passive underwater surveillance systems to the defence market.
